Factors Associated With Short-Term Bounce-Back Admissions After Emergency Department Discharge Gabayan GZ, Asch SM, Hsia RY, et al. Ann Emerg Med. 2013;62(2):136-144.e1. 報告者: R1鄭凱文 指導者: VS 吳柏衡	 Introduction bounce-back admissions → missed diagnoses of serious illness → incomplete ED care → insufficient outpatient f/u after discharge
 About This Study 1st large-scale analysis US p'ts admitted shortly after MBD from ED hospital & patient characteristics 	Goal of This Investigation • 7-day bounce-back admissions after ED discharge in a cohort of California hospitals • Prevalence ? • Characteristics ? • predictors ?
 data from OSHPD (Office of Statewide Health Planning and Development) study protocol was reviewed & approved by California Committee for Protection of Human Subjects institutional review board of the University of California at Los Angeles 	Method • retrospective cohort study • In 2007; in California • general, acute, nonfederal hospitals • ≥18y/o; discharged from ED • Bounce-back admission to an inpatient bed within 7 days of the ED visit

OR (95% CI) & Predicted Probability (%) top 6 primary discharge Dx associated with a bounce-back admission Index ED visit discharge diagnosis (ref=asthma) Chronic renal disease 3.3 (2.8–3.8)* 6.18 End-stage renal disease 2.9 (2.4–3.6) 5.57 Congestive heart failure 2.5 (2.3–2.6)* 4.69 Diseases of the blood 2.4 (2.2–2.6)* 4.58 Neoplasms 2.2 (2.0–2.4)* 4.24 Mental illness 2.0 (1.9–2.2)* 3.94	小结 • P'ts with a greater chance of returning&being admitted were • Older (4~5%) • AAD/eloped (~4%) • received a Dx of renal disease (~6%)
 findings cannot be generalized to the entire US population 	 Discussion For older p'ts who are less able to care for themselves their ability to recover
 OSHPD ED files lack data about preexisting comorbidities or visit acuity level 排除太多人 → 低估bounce-back admission rate 	their support mechanisms
For vulnerable p'ts	
 a key component of the ED evaluation → assessment of their access to care both before & after the ED visit 	 When encountering a p't who may leave before completion of the ED visit, providers should attempt to prevent the patient from leaving.

 Original sin of for-profit and teaching hospital 	 CRD/ESRD, CHF & Blood disease chronic conditions that often require regular encounters a limitation of appropriate follow-up care after the ED visit ?
CRD/ESRD • conditions that may seem stable but in reality harbor more devastating disease processes	 P'ts w/ mental illness substance abuse, psychosis, dementia & developmental delay Misdiagnosis↑ errors in communication & estimation of risk lack of the ability to receive proper f/u
 findings suggest that quality improvement efforts focus on high-risk individuals the old patients with renal disease disposition plan of patients include consideration of vulnerable individuals 	

High risk clinical characteristics for subarachnoid haemorrhage in patients with acute headache: prospective cohort study Perry JJ, Stiell IG, Sivilotti ML, et al. BMJ. 2010;341(oct28 1):c5204.	 Introduction Headache ~ 2% of all ED visits SAH → 1~3% of headache neurologically intact p'ts present with headache alone account for up to half of all patients with SAH
 Non-contrast CT + lumbar puncture Inefficient in alert p'ts w/ non-traumatic headache CT costs↑ Radiation →risk of cancer↑ > 95% of scans to r/o SAH → (-) Lumbar puncture Painful Might result in worse headache than the original 	Goal • assess clinical characteristics of p'ts in ED • neurologically intact • headache peaking w/i 1hr • to determine predictive variables for SAH
 Study design @ 6 university affiliated tertiary care teaching hospitals in Canada prospective multicentre cohort study Nov. 2000 ~ Nov. 2005 	Study population • p'ts ≥16y/o & GCS=15 • Presented to ED with a chief complaint of • non-traumatic headache peaking w/i 1hr • syncope associated with a headache

 exclusion history of ≥ 3 recurrent headaches of the same character and intensity as the presenting headache over 6m referred from other centers w/ a confirmed SAH papilloedema (determined by treating physician) new focal neurological deficits previous Dx of hydrocephalus, cerebral aneurysm, SAH, or brain neoplasm 	 Data collection Emergency physicians completed data forms to identify the presence or absence of 33 clinical findings in consecutive eligible patients. assessment by two physician independantly if feasible telephone f/u at 1 & 6 months when necessary
<section-header><section-header><list-item><list-item><list-item></list-item></list-item></list-item></section-header></section-header>	 P'ts discharged w/o CT & lumbar puncture reviewed medical records (both enrolled and missed eligible patients) telephone interview @ 1 & 6m
 Data analysis Univariate analyses determined the strength of the association between each of 26 possible predictor variables and the outcome variable Pearson's x² or Fisher's exact test for nominal variables unpaired two tailed t test for continuous variables 	 further explored variables of potential interest (on statistical or clinical basis) ensure the final model didn't contain continuous variables → clinicians could categorise patients w/o performing any calculations interobserver agreement for each variable κ coefficient Spearman's interclass coefficient

103 p'ts who had two independent physician assessments

- substantial interobserver agreement
 - being awoken by headache
 - transient loss of consciousness
 - Vomiting
 - complaint of neck stiffness or pain
 - onset with exertion
 - peak pain intensity

Poor Interobserver agreement

- the worst headache of life
- needing to rest
- time from onset to peak of headache

Example of recursive partitioning analysis

lule 2†						
ligh risk	130	1186	100%	36.5%	100%	102512
ow risk	0	683	(97.1% to 100.0%)	(34.4% to 38.8%)	(99% to 100%)	65.8%
tule 3‡						
sigh risk	130	1143	100%	38.8%	100%	1000-000-0
ow risk	0	726	(97.1% to 100.0%)	(36.7% to 41.1%)	(99% to 100%)	63.7%

Variables included in each of three proposed rules For each rule, patients should be investigated if one or more of the variables are present

Rule 1

- Age >40
 Complaint of pack
- Complaint of neck pain or stiffness
 Witnessed loss of consciousness
- Onset with exertion
- Rule 2
- Arrival by ambulance
- Age >45
- Vomiting at least once
- Diastolic blood pressure >100 mm Hg
- Rule 3
- Arrival by ambulance
 Sustalic blood processors 160 mm
- Systolic blood pressure >160 mm Hg
 Complaint of neck pain or stiffness
- Complaint of neck pain or s
 Age 45-55
- Age 45-55

Discussion

- Variables strongly and reliably associated with SAH
 - Arrival by ambulance
 - Age ≥40
 - complaint of neck stiffness or pain
 - onset with exertion
 - Vomiting
 - witnessed loss of consciousness
 - raised BP

 More selective testing can also shorten length of stay in an overcrowded ED CT → + 3hrs Lumbar puncture → + 4hrs Can J Emerg Med2002;4:333-7. 	 variables proposed by other studies ♀ >50y/o、 ☆ < 50y/o、 stressful events Drinking, smoking, HTN and oral contraceptives prevalent among many patients in ED might not be clinically useful for differentiating SAH from other headaches.
 Uncommon connective tissue disorders can lead to SAH Ehlers-Danlos syndrome type IV ADPKD autosomal dominant polycystic kidney disease Marfan's syndrome, can lead to subarachnoid haemorrhage 	 Why keep one model w/o the ambulance variable for additional study ? Given the heterogeneity of headache, it would be impractical to generate one clinical decision rule for all causes.
 rules should not be applied to p'ts with chronic recurrent headaches 	Clinical implications • considered carefully for SAH if • Age ≥40 • witnessed loss of consciousness • complaint of neck pain or stiffness • onset with exertion • arrival by ambulance • Vomiting • diastolic BP ≥100 mmHg • systolic BP ≥160 mm Hg

Clinical decision rules to rule out subarachnoid hemorrhage for acute headache. Perry JJ, Stiell IG, Sivilotti ML, et al. JAMA. 2013;310(12):1248-55.	 Introduction Headache ~ 2% of all ED visits SAH → 1~3% of headache diagnostic dilemma → 50% SAH is on p'ts with headache alone 5.4% SAH were missed during initial ED assessment Stroke. 2007;38(4):1216-1221.
3 rules, each have 4 variables Box 1. Variables Included in Each of the 3 Proposed Rules Rule 1 Investigate if ≥1 high-risk findings present: 1. Age ≥40 y 2. Neck pain or stiffness 3. Witnessed loss of consciousness 4. Onset during exertion Rule 2 Investigate if ≥1 high-risk findings present: 1. Age ≥45 y 2. Arrival by ambulance 3. Vomiting (≥1 episodes) 4. Diastolic blood pressure ≥100 mm Hg Rule 3 Investigate if ≥1 high-risk findings present: 1. Age 45-55 y 2. Neck pain or stiffness 3. Arrival by ambulance 4. Systolic blood pressure ≥160 mm Hg	Method • prospective multicenter cohort study • ED of 10 university-affiliated urban Canadian tertiary care teaching hospitals • April 2006~July 2010
enrollment • p'ts ≥16y/o & GCS=15 • Presented to ED with a chief complaint of • non-traumatic headache peaking w/i 1hr • no fall or direct head trauma in previous 7 days • presented w/i 14 days of headache onset	 ineligibility established recurrent headache syndromes referred from other centers w/ a confirmed SAH papilloedema (determined by treating physician) new focal neurological deficits previous Dx of hydrocephalus, cerebral aneurysm, SAH, or brain neoplasm

 The research ethics board → no need for written consent 	 Assessment record 19 clinical findings on data forms before ordering CT or CSF analysis Sensibility (1) Are investigations indicated for this p't according to the decision rule? (Yes/No) (2) How comfortable would you be in actually using the rule for this p't? (5-point scale)
 assessment by two physician independantly if feasible telephone f/u at 1 & 6 months when necessary 	 Outcome measures SAH subarachnoid blood on non-contrast brain CT with an aneurysm or arteriovenous malformation evident on cerebral angiography RBC (>1 × 10^{6/L}) in the final sample of CSF xanthochromia in CSF
 Physicians were instructed not to alter their practice according to the proposed rules. Proxy Outcome Assessment Tool 	Statistical Analysis • Interobserver agreement $\rightarrow \kappa$ coefficient • Univariate analysis • continuous variables $\rightarrow 2$ -sided t test • categorical variables $\rightarrow Pearson \chi^{2 test}$ • Potential refinement of the rules \rightarrow multivariate recursive partitioning analysis

Table 3. Sensitivity, Specificity, and Negative Predictive Value of the Original Derived Rules and the Ottawa SAH Rule for Subarachnoid Hemorrhage Result of Assessment Rule Result of Assessment Rule 5AH 130 126 128 132 No SAH 147 128 1388 1694 Negative, No. 126 12 138 1004 SAH 2 6 4 0 No SAH 552 712 611 3005 Sensitivity, % 98.5 (94.6-99.6) 95.5 (90.4-97.9) 97.0 (92.5-98.8) 100.0 (97.2-100.0) Sensitivity, % 98.5 (94.6-99.6) 99.0 99.4 1000.0 Sensitivity, % 98.6 (94.6-99.6) 99.0 99.4 1000.0 Interobserver agreement, K (55% CI) 0.86 (0.70-1.0) 0.59 (0.58-12.6) 1.36 (1.31-1.40) 1.48 (1.41-1.55) 1.39 (1.33-1.45) 1.17 (1.15-1.20) Negative 0.054 (0.013-0.21) 0.127 (0.058-0.27) 0.059 (0.037-0.26) 0.024 (0.001-0.39)					 bootstrap analysis for Ottawa SAH Rule using the previous phase 1 derivation data set sensitivity 100% (95% CI, 100%-100%) specificity 20.6% (95% CI, 20.5%-20.6%) combined cohort (N=1999+2131) sensitivity 100% (95% CI, 98.6%-100%) specificity 17.8% (95% CI, 16.6%-19.1%)
potential influence on clinical practice • baseline rate of investigation \rightarrow 84.3% • Rule 1 \rightarrow 74.0% • Rule 2 \rightarrow 71.0% • Rule 3 \rightarrow 66.4% • Ottawa SAH Rule \rightarrow 85.7%					 Sensitivity↑ the trade-off is loss of specificity testing ↑ associated costs ↑ Ottawa SAH Rule does not lead to a reduction of testing
Discussion • it is impractical to generate a single clinical decision rule for all causes of headache					 physicians may overlook exclusion criteria Headaches different from the patient's usual headache pattern → represent a different etiology → need investigation

- Additional study could assess the relative benefits in rural vs urban settings.
- The Ottawa SAH Rule may help to standardize which patients with acute headache require investigations.

Box 2. The Ottawa SAH Rule

For alert patients older than 15 y with new severe nontraumatic head-ache reaching maximum intensity within 1 h $\,$

Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumors, or history of recurrent headaches (\geq 3 episodes over the course of \geq 6 mo)

Investigate if ≥ 1 high-risk variables present:

- 1. Age ≥40 y
- 2. Neck pain or stiffness
- 3. Witnessed loss of consciousness
- 4. Onset during exertion
- 5. Thunderclap headache (instantly peaking pain)
- 6. Limited neck flexion on examination

SAH indicates subarachnoid hemorrhage.
